## Stability Analysis of Many Species Population Dynamics

In this exercise we study the evolution of 6 populations according to the following equations for population dynamics: 3 predator- ( $P_i$ ) and 3 prey-species ( $N_i$ ), all parameters positive, always  $i, j = 1, \dots, 3$ :

$$\frac{dN_i}{dt} = N_i \left( a_i - N_i - \sum_j b_{ij} P_j \right) \quad \text{and} \quad \frac{dP_i}{dt} = P_i \left( \sum_j c_{ij} N_j - d_i \right) \quad (1)$$

The parameters chosen are  $a_1 = 56$ ,  $a_2 = 12$ ,  $a_3 = 35$ ,  $d_1 = 85$ ,  $d_2 = 9$  and  $d_3 = 35$ ; the parameters  $b_{ij}$  and  $c_{ij}$  are given in matrix form here:

$$b_{ij} = \begin{pmatrix} 20 & 30 & 5 \\ 1 & 3 & 7 \\ 4 & 10 & 20 \end{pmatrix} \quad \text{and} \quad c_{ij} = \begin{pmatrix} 20 & 30 & 35 \\ 3 & 3 & 3 \\ 7 & 8 & 20 \end{pmatrix} \quad (2)$$

**Notices:** The unusual feature here in the equations is that the prey populations  $N_i$  have a Verhulst style growth limiting factor in their equations, which limits their growth even if there is no predator (model for limited resources even in absence of predators).

- Please do not try to make the equations dimensionless, just use the numbers given here.
- In this mathematical example the solutions can become negative in some cases, which is unphysical for population dynamics. Nevertheless let us please use this case to show the mathematical features.

**Task:** What are the fixed points (FP) for the system of equations given above? *Hint 1:* No complicated computations are necessary, the idea is that you should guess the fixed points very easily. Compare our previous examples. *Hint 2:* This time there are three fixed points! In addition to our “usual” ones, there is a third one related to the Verhulst growth limiting factor in the first three equations.

condition for fixed points (FP) in the case of interacting populations:

$$n = n^* \text{ stationary point of the system} \quad \Longleftrightarrow \quad f(n^*) := \left. \frac{dn}{d\tau} \right|_{n=n^*} = 0 \quad (3)$$

stability analysis in the multi-dimensional case: analogous to one-dimensional, but vector form:

$$\vec{f}(\vec{N}, \vec{P}) = \begin{pmatrix} \dot{\vec{N}} \\ \dot{\vec{P}} \end{pmatrix} \quad (4)$$

with

$$\dot{\vec{N}} = \frac{d\vec{N}}{dt} = \begin{pmatrix} \dot{N}_1 \\ \dot{N}_2 \\ \dot{N}_3 \end{pmatrix} = \begin{pmatrix} n_1(N_1, \vec{P}) \\ n_2(N_2, \vec{P}) \\ n_3(N_3, \vec{P}) \end{pmatrix} \quad \text{and} \quad \dot{\vec{P}} = \frac{d\vec{P}}{dt} = \begin{pmatrix} \dot{P}_1 \\ \dot{P}_2 \\ \dot{P}_3 \end{pmatrix} = \begin{pmatrix} p_1(P_1, \vec{N}) \\ p_2(P_2, \vec{N}) \\ p_3(P_3, \vec{N}) \end{pmatrix} \quad (5)$$

$$n_i(N_i, \vec{P}) := \frac{dN_i}{dt} = N_i \left( a_i - N_i - \sum_j b_{ij} P_j \right) \quad (6)$$

$$p_i(P_i, \vec{N}) := \frac{dP_i}{dt} = P_i \left( \sum_j c_{ij} N_j - d_i \right) \quad (7)$$

$$\begin{cases} \dot{N}_1 = N_1 (56 - N_1 - 20P_1 - 30P_2 - 5P_3) \\ \dot{N}_2 = N_2 (12 - N_2 - P_1 - 3P_2 - 7P_3) \\ \dot{N}_3 = N_3 (35 - N_3 - 4P_1 - 10P_2 - 20P_3) \\ \dot{P}_1 = P_1 (20N_1 + 30N_2 + 35N_3 - 85) \\ \dot{P}_2 = P_2 (3N_1 + 3N_2 + 3N_3 - 9) \\ \dot{P}_3 = P_3 (7N_1 + 8N_2 + 10N_3 - 35) \end{cases} \quad (8)$$

$$d_i = \sum_j c_{ij} N_j^* \implies \begin{cases} 85 = 20N_1^* + 30N_2^* + 35N_3^* \\ 9 = 3N_1^* + 3N_2^* + 3N_3^* \\ 35 = 7N_1^* + 8N_2^* + 10N_3^* \end{cases} \implies N_i^* = 1 \quad (9)$$

$$N_i^* = a_i - \sum_j b_{ij} P_j^* \xrightarrow{N_i^* = 1} \begin{cases} 1 = 56 - (20P_1^* + 30P_2^* + 5P_3^*) \\ 1 = 12 - (P_1^* + 3P_2^* + 7P_3^*) \\ 1 = 35 - (4P_1^* + 10P_2^* + 20P_3^*) \end{cases} \implies P_i^* = 1 \quad (10)$$

$$\vec{P}^* = \begin{pmatrix} P_1^* \\ P_2^* \\ P_3^* \end{pmatrix} = \begin{pmatrix} 0 \\ 0 \\ 0 \end{pmatrix} \implies N_i^* = a_i - \sum_j b_{ij} P_j^* = a_i \implies \vec{N}^* = \begin{pmatrix} N_1^* \\ N_2^* \\ N_3^* \end{pmatrix} = \begin{pmatrix} 56 \\ 12 \\ 35 \end{pmatrix} \quad (11)$$

“usual” fixed points:

$$N_i^* = P_i^* = 0 \quad \text{and} \quad N_i^* = P_i^* = 1 \quad (12)$$

third fixed point:

$$P_i^* = 0 \quad \text{and} \quad N_i^* = a_i \quad (13)$$

$$\begin{pmatrix} \vec{N}^* \\ \vec{P}^* \end{pmatrix} \text{ fixed point} \iff \vec{f}(\vec{N}^*, \vec{P}^*) = \vec{0} \quad (14)$$

Jacobi matrix:

$$D\vec{f} = \begin{pmatrix} \frac{\partial n_1}{\partial N_1} & 0 & 0 & \frac{\partial n_1}{\partial P_1} & \frac{\partial n_1}{\partial P_2} & \frac{\partial n_1}{\partial P_3} \\ 0 & \frac{\partial n_2}{\partial N_2} & 0 & \frac{\partial n_2}{\partial P_1} & \frac{\partial n_2}{\partial P_2} & \frac{\partial n_2}{\partial P_3} \\ 0 & 0 & \frac{\partial n_3}{\partial N_3} & \frac{\partial n_3}{\partial P_1} & \frac{\partial n_3}{\partial P_2} & \frac{\partial n_3}{\partial P_3} \\ \frac{\partial p_1}{\partial N_1} & \frac{\partial p_1}{\partial N_2} & \frac{\partial p_1}{\partial N_3} & \frac{\partial p_1}{\partial P_1} & 0 & 0 \\ \frac{\partial p_2}{\partial N_1} & \frac{\partial p_2}{\partial N_2} & \frac{\partial p_2}{\partial N_3} & 0 & \frac{\partial p_2}{\partial P_2} & 0 \\ \frac{\partial p_3}{\partial N_1} & \frac{\partial p_3}{\partial N_2} & \frac{\partial p_3}{\partial N_3} & 0 & 0 & \frac{\partial p_3}{\partial P_3} \end{pmatrix} \quad (15)$$

$$\frac{\partial n_i}{\partial N_i} = \frac{\partial}{\partial N_i} \left[ N_i \left( a_i - N_i - \sum_j b_{ij} P_j \right) \right] = \left( a_i - N_i - \sum_j b_{ij} P_j \right) - N_i \quad (16)$$

$$\frac{\partial p_i}{\partial P_i} = \frac{\partial}{\partial P_i} \left[ P_i \left( \sum_j c_{ij} N_j - d_i \right) \right] = \sum_j c_{ij} N_j - d_i \quad (17)$$

$$\frac{\partial n_i}{\partial P_j} = \frac{\partial}{\partial P_j} \left[ N_i \left( a_i - N_i - \sum_j b_{ij} P_j \right) \right] = -N_i b_{ij} \quad (18)$$

$$\frac{\partial p_i}{\partial N_j} = \frac{\partial}{\partial N_j} \left[ P_i \left( \sum_j c_{ij} N_j - d_i \right) \right] = P_i c_{ij} \quad (19)$$

$$\mathbf{A} := D\vec{f}(N_i^* = P_i^* = 1) = \begin{pmatrix} -1 & 0 & 0 & -20 & -30 & -5 \\ 0 & -1 & 0 & -1 & -3 & -7 \\ 0 & 0 & -1 & -4 & -10 & -20 \\ 20 & 30 & 35 & 0 & 0 & 0 \\ 3 & 3 & 3 & 0 & 0 & 0 \\ 7 & 8 & 20 & 0 & 0 & 0 \end{pmatrix} \quad (20)$$

**Task:** What is the Jacobi matrix  $\mathbf{A}$  at the non-trivial fixed point? (non-trivial FP means here that *all* elements are unequal to zero. There is only one FP with this property)

**Task:** Determine the eigenvalues and eigenvectors  $\lambda_i$  and  $\mathbf{v}_i$  ( $i = 1, \dots, 6$ ) of  $\mathbf{A}$  for this fixed point. Choose an initial state

$$\mathbf{n} = \sum_{i=1}^6 c_i \mathbf{v}_i \quad \text{with} \quad c_1 = c_2 = 3, \quad c_3 = c_4 = 1, \quad c_5 = -5, \quad c_6 = 0.1 \quad (21)$$

Plot and discuss the time dependent evolution of the six populations (given by this linear model); in particular what about oscillations, growth or decay?
